EYECONIQUE BEAUTY

LIP BLUSH

Aftercare Guide

WHAT TO EXPECT

Swelling, tenderness, warmth, and brighter or deeper colour are common immediately after treatment. Lips usually begin to feel dry or flaky over the next few days, and the colour can look much lighter before it settles.

FIRST 24-48 HOURS

- Wash hands before touching the lips.
- Keep the area clean and use only the aftercare product recommended by Eyeconique.
- Apply a very thin layer as directed; avoid repeatedly rubbing or over-applying product.
- Drink carefully and blot gently if needed. Use clean cups, utensils, and straws if they make contact more comfortable.
- Avoid lipstick, gloss, exfoliants, and non-recommended lip products until the surface has healed.

UNTIL FLAKING IS COMPLETE

- Do not pick, peel, bite, or scrub the lips.
- Avoid swimming, saunas, steam, hot tubs, prolonged heat, and heavy sweating.
- Avoid very spicy, acidic, or salty foods if they sting or irritate the fresh lips.
- Avoid kissing or other direct mouth contact while the surface is freshly healing.
- Keep toothpaste, skincare acids, retinoids, and exfoliants off the treated lip tissue.

HEALING TIMELINE

- Days 1-2: colour looks brightest and swelling may be present.
- Days 3-7: dryness and flaking can occur; colour may soften dramatically.
- Weeks 2-4: colour may look very light before gradually returning.
- Weeks 4-8: healed colour and retention can be assessed more accurately.

COLD SORES

If a cold sore develops, follow your physician or pharmacist's advice. Do not pick at the area, and let Eyeconique know so healing can be monitored appropriately.

FUTURE SESSIONS

Perfecting sessions are evaluated only after the lips are fully healed. Dark lip neutralization commonly requires multiple sessions and no specific healed colour can be guaranteed.

LONG-TERM CARE

Once healed, keep lips moisturized and use SPF lip protection. Sun exposure, smoking, exfoliation, and individual skin chemistry can affect longevity.

WHEN TO SEEK MEDICAL CARE

Seek medical attention for worsening redness, pus, severe or increasing swelling, fever, significant pain, difficulty breathing, or other symptoms that concern you.

Let the colour settle

The light phase is normal. Give your lips time to fully heal before deciding how much colour has retained.
